

# Find more, miss fewer, help better

Displaying the best predictive accuracy in the industry, One Care Street effectively identifies the 12 – 15% of individuals in a given population who will likely incur 70 – 80% of near-term healthcare costs. Not only does this help the bottom line, but it also changes lives for the better.

Your population

## Common Approach

Although 10 – 15% will incur high healthcare costs, disease management typically only identifies 1 – 5% as high risk.

Out of that 5% the average engagement rate for intervention is 30%, leaving little true involvement with your population.

## One Care Street Approach

Using the OCS Predictive Model, 12 – 15% are correctly identified as high risk.

Out of that 15% our average engagement rate for intervention is 70%. More engagement means you are changing peoples lives and helping your bottom line.

*Impact your population and your bottom line!*
